

## California Rapid Assessment Method for Wetlands (CRAM)

### Buffer and Landscape Context Attribute

---

---

---

---

---

---

---

---

### Buffer and Landscape Context Attribute

- *Presence and/or continuity of wetlands and riparian areas adjacent to the AA*
- *Size and quality of buffer surrounding AA*

---

---

---

---

---

---

---

---

### Background

- *Buffer zone is the transition between the margins of the wetland and the surrounding environment*
  - *Filter pollutants*
  - *Refuge for wildlife during high water*
  - *Barriers to disruptive incursions (people/pets)*
  - *Reduce risk of invasion by non-native plants and animals*

---

---

---

---

---

---

---

---

## Background

- *Regulation/Protection historically did not include adjacent uplands*
  - *Converted to recreation, agricultural, urban landuses*
  - *No longer provide critical buffer functions*

---

---

---

---

---

---

---

---

## Wetlands in the Physical Landscape

State of *landscape stressors* is assessed outside the buffer

*Condition is assessed at all three scales*

*Wetland condition* results from internal and external influences

*Buffer* exists between landscape stressors and the wetland

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

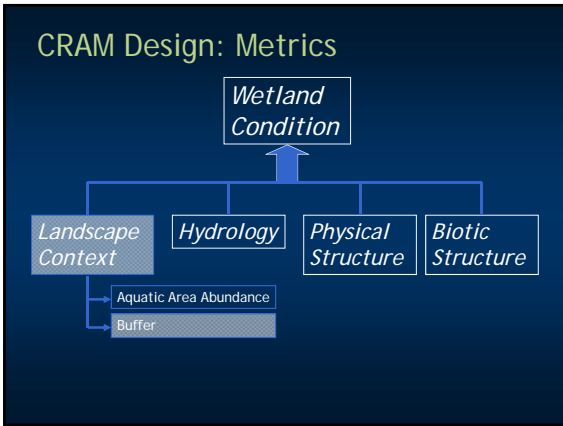

---

---

---

---

---

---

---

---

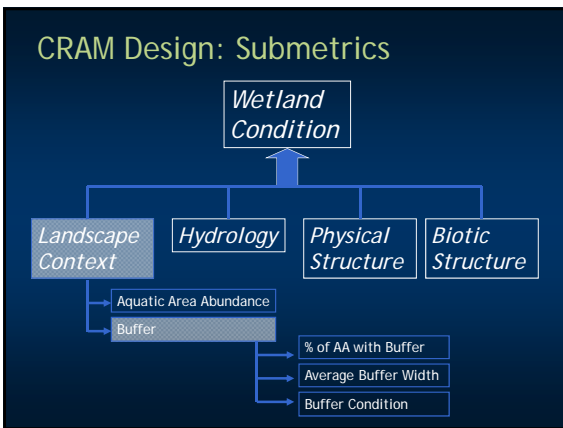

---

---

---

---

---

### Aquatic Area Abundance Metric

- Assess AA in terms of its spatial association with other "aquatic resources"
- Wetlands close to each other have greater potential to interact ecologically:
  - Provide refuge, support migratory populations, function as sources of colonists for newly created wetlands

---

---

---

---

---

---

---

---

### Aquatic Area Abundance Metric

- Landscape variables are good predictors of wetland integrity (Roth et al. 1996, Scott et al. 2002)
- Wetlands are components of habitat mosaics
- Mosaic components have additive influences on processes: flooding, contaminant filtration, wildlife support
- Processes influence form and function
- Functional capacity partly determined by landscape relationships

---

---

---

---

---

---

---

---

### Aquatic Area Abundance Metric

- The Aquatic Area Abundance metric is called Stream Corridor Continuity for Riverine wetlands.
- This metric is assessed one of four ways, depending on the wetland type:
  - Aquatic Area Abundance: Estuarine, Depressional, Slope
  - Aquatic Area Abundance: Bar Built Estuarine
  - Aquatic Area Abundance: Vernal Pool Systems, Individual Vernal Pools
  - Stream Corridor Continuity: Riverine

---

---

---

---

---

---

---

---

### Aquatic Area Abundance Metric: Estuarine, Depressional, and Slope wetlands

- From the edge of the AA, draw four lines in cardinal compass directions 500m long on the aerial photo and determine the average percent of each line crossing aquatic habitat
- Include open water

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Stream Corridor Continuity Metric: Riverine

- Assesses riparian continuity
- Assume riparian area average width is the same upstream and downstream of the AA as it is within the AA
- Slide this "moving window" of riparian area width 500m upstream and 500m downstream from the AA boundary looking for areas of "non-buffer" land cover
- To break continuity, a segment of "non-buffer" cover must:
  - extend across at least one side of the riparian area
  - extend at least 10m along the channel
- A break that occurs on both sides (e.g. a bridge) is counted twice, once for each side

---

---

---

---

---

---

---

---

### Stream Corridor Continuity Metric: Riverine

Assess the total length of non-buffer segments  
500m upstream and 500m downstream of the AA

---

---

---

---

---

---

---

---

### Buffer Metric

- Buffer: a zone of transition between the wetland and its surrounding environment
- Buffers entrap contaminants, discourage visitation into the AA, and protect the AA from stress and disturbance
- Buffers reduce flood and drought risk and improve water quality
- Buffers maintain integrity and therefore resilience of wetland communities

---

---

---

---

---

---

---

---

## Buffer Functions

- Reduces watershed imperviousness by 5%. An average buffer width of 100 feet protects up to 5% of watershed area from future development.
- Areas of impervious cover are distanced from the stream.
- Reduces small drainage problems and complaints.
- Stream "right of way" allows for lateral movement.
- Provides effective flood control. Other, expensive flood controls are not necessary if buffer includes the 100-yr floodplain.

*In: The Practice of Watershed Protection, 2000. Watershed Protection Techniques 1(4): 155-163.*

---

---

---

---

---

---

---

---

## Buffer Functions: Nutrient Removal

Figure 1. Relationship of nitrogen removal effectiveness to riparian buffer width. All studies combined. Lines indicate probable 50%, 75%, and 90% nitrogen removal efficiencies based on the fitted non-linear model.

Mayer et al., 2005

---

---

---

---

---

---

---

---

## Buffer Metric

- Three submetrics:
  - Percent of AA with Buffer
  - Average Buffer Width
  - Buffer Condition
- The score is calculated so that the area and the condition of the buffer are weighted equally
- The combination of area and condition determine the overall capacity to perform critical functions

---

---

---

---

---

| Examples of Land Covers Included in Buffers  | Examples of Land Covers Excluded from Buffers   |
|--|---|
| <ul style="list-style-type: none"> <li>at-grade bike and foot trails with light traffic</li> <li>horse trails</li> <li>natural upland habitats</li> <li>nature or wildland parks</li> <li>range land and pastures</li> <li>railroads (with infrequent use: 2 trains per day or less)</li> <li>roads not hazardous to wildlife, such as seldom used rural roads, forestry roads or private roads</li> <li>swales and ditches</li> <li>vegetated levees</li> </ul> | <p>Notes: buffers do not cross these land covers; areas of open water adjacent to the AA are not included in the assessment of the AA or its buffer.</p> <ul style="list-style-type: none"> <li>commercial developments</li> <li>fences that interfere with the movements of wildlife (i.e. food safety fences that prevent the movement of deer, rabbits and frogs)</li> <li>intensive agriculture (row crops, orchards and vineyards)</li> <li>golf courses</li> <li>paved roads (two lanes or larger)</li> <li>active railroads (more than 2 trains per day)</li> <li>lawns</li> <li>parking lots</li> <li>horse paddocks, feedlots, turkey ranches, etc.</li> <li>residential areas</li> <li>sound walls</li> <li>sports fields</li> <li>urbanized parks with active recreation</li> <li>pedestrian/bike trails (with heavy traffic)</li> </ul> |

---

---

---

---

---

---

---

---

---

---

---

---

### Included as buffer

*roads not hazardous to wildlife*

*at grade bike and foot trails*

*vegetated levees*

*open rangeland*

\*See the CRAM Photo Dictionary for more examples

---

---

---

---

---

---

---

---

---

---

---

---

### Excluded from buffer

*parking lots*

*intensive agriculture (row crops, orchards and vineyards)*

*sound walls or other concrete walls*

*golf course*

\*See the CRAM Photo Dictionary for more examples

---

---

---

---

---

---

**Submetric: Percent of AA with Buffer**

- The ability to protect a wetland increases with buffer coverage along the wetland perimeter
- For some stressors (e.g. feral pet predation) even small breaks in buffer allow the stressor into the wetland
- For most stressors, small breaks in buffer (e.g. from trails) do not significantly disrupt buffer functions

---

---

---

---

---

---

---

---

**Submetric: Percent of AA with Buffer**

Estimate percent of the AA perimeter adjoining buffer land cover that is at least 5m wide and 5m long.

| Rating   | Alternative States                   |
|----------|--------------------------------------|
| A        | Buffer is > 75-100% of AA perimeter  |
| B        | Buffer is > 50 - 74% of AA perimeter |
| <b>C</b> | Buffer is 25 - 49% of AA perimeter   |
| D        | Buffer is < 25% of AA perimeter      |

---

---

---

---

---

---

---

---

**Submetric: Percent of AA with Buffer**

- Open water (wider than 30m) directly adjoining the AA is neutral because:
  - Inflates score
  - Requires lab analysis for water quality
  - Can be a direct or indirect source of stress, or benefit to wetland

---

---

---

---

---

---

---

---

### Submetric: Average Buffer Width

- Wider buffers have greater capacity to:
  - Serve as habitat
  - Reduce non-point source contaminants
  - Control erosion
  - Protect the wetland from human activities

---

---

---

---

---

---

---

---

---

---

### Submetric: Average Buffer Width

| Worksheet for calculating average buffer width of AA |                  |
|--|------------------|
| Line   | Buffer Width (m) |
| A  | 100              |
| B  | 170              |
| C  | 250              |
| D  | 250              |
| E  | 250              |
| F  | 40               |
| G  | 20               |
| H  | 30               |
| <b>Average Buffer Width</b>                          | <b>139</b>       |

| Rating   | Alternative States                   |
|----------|--------------------------------------|
| A        | Average buffer width is 190 – 250 m. |
| <b>B</b> | Average buffer width is 130 – 189 m. |
| C        | Average buffer width is 65 – 129 m.  |
| D        | Average buffer width is 0 – 64 m.    |

---

---

---

---

---

---

---

---

- ### Submetric: Buffer Condition
- Condition of the buffer combined with width and extent determine overall capacity to perform critical functions
  - Method is the same across all wetland types
  - Assessed based on field indicators only
  - Buffer characteristics examined:
    - Native vs non-native vegetation
    - Soil disturbance or compaction
    - Intensity of human visitation

---

---

---

---

---

---

---

---

### Submetric: Buffer Condition

| Alternative States |  |
|--------------------|--|
| A                  | Buffer for AA is dominated by <u>native vegetation</u> , has <u>undisturbed soils</u> , and is apparently subject to <u>little or no human visitation</u> .  |
| B                  | 1) Buffer for AA is characterized by an intermediate <u>mix of native and non-native vegetation (25-75%)</u> , but mostly <u>undisturbed soils</u> and is apparently subject to <u>little or low impact human visitation</u> .                                       |
|                    | OR   |
| C                  | 2) Buffer for AA is dominated by <u>native vegetation</u> , but shows <u>some soil disturbance</u> and is apparently subject to <u>little or low impact human visitation</u> .   |
|                    | Buffer for AA is characterized by <u>substantial (&gt;75%) amounts of non-native vegetation</u> AND there is at least a moderate degree of <u>soil disturbance/compaction</u> , and/or there is evidence of at least <u>moderate intensity of human visitation</u> . |
| D                  | Buffer for AA is characterized by <u>barren ground</u> and/or <u>highly compacted or otherwise disturbed soils</u> , and/or there is evidence of <u>very intense human visitation</u> , or there is <u>no buffer</u> present.  |
